[Documentation] Need documentation and examples for Joint Fabric group management with chip-tool #43018

Open

Task

eniac00 opened on Feb 8

Documentation issues

Summary:

I am trying to understand how to work with Joint Fabric features in `chip-tool`, specifically for group management operations. My goal is to learn how to:

- Create a joint fabric group
- Add nodes to a group
- Update group information
- Remove nodes from a group
- Delete a group

As a newcomer to Matter and `chip-tool`, I'm finding the current documentation insufficient for practical implementation.

Current Documentation Status:

I have reviewed the [Joint Fabric Guide](#), which explains how to build and initialize the `jointfabricadministrator` and `jointfabricdatastore` clusters. However, it lacks:

- Step-by-step command examples for group operations
- Parameter explanations for joint fabric datastore commands
- Practical workflow examples showing the complete process from setup to group control
- Explanation of the relationship between regular groups and joint fabric groups

Available Commands (but no usage documentation):

From `chip-tool jointfabricdatastore`, I can see commands like:

- `add-group`
- `update-group`
- `remove-group`
- `add-group-idto-endpoint-for-node`
- `remove-group-idfrom-endpoint-for-node`
- `add-key-set`

However, there is no documentation explaining:

- What parameters these commands require
- The correct sequence to execute them
- How they differ from the standard groups cluster operations
- Prerequisites and dependencies between commands

What I've Tried:

After successfully building and running the joint fabric administrator and datastore applications following the guide, I attempted to create a group:

```
./jfc-app jointfabricdatastore add-group 10 "SecurityGroup" 1 0xABCD 1 3 1 0
```

But executing this command results in an "unsupported cluster" error.

Without detailed documentation or working examples, it's difficult to diagnose what's wrong or what the correct approach should be.

Request:

- A complete working example of creating and managing a joint fabric group using `chip-tool` or `jfc-app`
- Documentation explaining the parameters for `jointfabricdatastore` commands
- A workflow diagram or step-by-step guide showing the relationship between different joint fabric operations
- Clarification on when to use joint fabric groups vs. regular groups
- Common troubleshooting tips for "unsupported cluster" errors in joint fabric context

Any guidance or documentation improvements would be greatly appreciated. Thank you for your support.
